In their own words

“Nepal aspires to minimize emissions and sustainably achieve net-zero emissions by the year 2045. In the with existing measures (WEM) scenario, the net CO₂ emissions will be reduced by 30 mMtCO₂ in 2030 and 50 mMtCO₂ in 2050. In this scenario, the energy sector will be one of the most important contributors to emission reductions. LULUCF will contribute significantly to carbon removal in the first 10 years. However, the sink potential of LULUCF will decrease overtime per the assumptions used in this scenario. As a result, after 2030, net carbon emissions will rise at an annual rate of 11 per cent. In the
